Project Design Phase
Solution Architecture

Date	05 April 2026
Team ID	**SWTID-2026-5577**
Project Name	Automating Data Import and Relationship Mapping Using Import Sets & Dot Walking
Maximum Marks	4 Marks

Solution Architecture:

The proposed solution architecture is designed to automate the process of importing external data into ServiceNow and establishing relationships between tables.

Architecture Flow

1. **External Data Source**
   - Data is created in CSV/Excel sheets
   - Acts as the input source
2. **Data Source Configuration**
   - File is uploaded into ServiceNow
   - Data Source is defined to read the file
3. **Import Set (Staging Table)**
   - Temporary table stores raw data
   - Ensures safe handling before processing
4. **Transform Map**
   - Defines mapping between source and target fields
   - Uses Mapping Assist for accuracy
5. **Data Transformation**
   - Data is cleaned, validated, and inserted into target table
   - Coalesce prevents duplicate records
6. **Dot Walking (Relationship Mapping)**
   - Links related tables (e.g., User → Department)
   - Automatically fetches related data
7. **Final Output**
   - Data is stored in target table
   - Relationships are visible (e.g., department displayed)
